

CONVOLUTIONAL NEURAL NETWORK (CNN) FOR HANDWRITTEN DIGITS RECOGNITION

DEEP LEARNING

29/05/2017

Luca BENEDETTO | Alberto IBARRONDO

Summary

In the last notebook, we built a Multilayer Perceptron for recognizing hand-written digits from the MNIST data-set. The best achieved accuracy on testing data was about 97%, but modern implementations of Convolutional Neural Networks should surpass that mark.

In this notebook, we will build, train and optimize in TensorFlow one of the early Convolutional Neural Networks, **LeNet-5**, and push it beyond 99% accuracy.

1. A first NeuralNetwork model in TensorFlow

1.1 Import Modules & Load MNIST Data in TensorFlow

```
In [117]: import tensorflow as tf
from tensorflow.examples.tutorials.mnist import input_data
from tensorflow.contrib.layers import flatten
from __future__ import print_function
from numpy import array
import numpy as np
import time
```

```
In [190]: mnist = input_data.read_data_sets("MNIST_data/", one_hot=True)
X_train, y_train = mnist.train.images, mnist.train.labels
X_validation, y_validation = mnist.validation.images, mnist.validation.labels
X_test, y_test = mnist.test.images, mnist.test.labels
print("Image Shape: {}".format(X_train[0].shape[0]))
print("Training Set: {} samples".format(len(X_train)))
print("Validation Set: {} samples".format(len(X_validation)))
print("Test Set: {} samples".format(len(X_test)))
```

```
Extracting MNIST_data/train-images-idx3-ubyte.gz
Extracting MNIST_data/train-labels-idx1-ubyte.gz
Extracting MNIST_data/t10k-images-idx3-ubyte.gz
Extracting MNIST_data/t10k-labels-idx1-ubyte.gz
Image Shape: 784
Training Set: 55000 samples
Validation Set: 5000 samples
Test Set: 10000 samples
```

Before starting with CNN, let's train and test in TensorFlow a simple example : $y = \text{softmax}(Wx + b)$

This model should reach an accuracy of about 92 %.

1.2 Coding the Graph and Training

```
In [2]: #GRAPH DEFINITION

# Parameters
learning_rate = 0.01
training_epochs = 100
batch_size = 128
display_step = 1
logs_path = 'log_files/' # useful for tensorboard

# tf Graph Input: mnist data image of shape 28*28=784
x = tf.placeholder(tf.float32, [None, 784], name='InputData')
# 0-9 digits recognition, 10 classes
y = tf.placeholder(tf.float32, [None, 10], name='LabelData')

# Set model weights
W = tf.Variable(tf.zeros([784, 10]), name='Weights')
b = tf.Variable(tf.zeros([10]), name='Bias')

# Construct model and encapsulating all ops into scopes,
# making Tensorboard's Graph visualization more convenient
with tf.name_scope('Model'):
    # Model
    pred = tf.nn.softmax(tf.matmul(x, W) + b) # Softmax
with tf.name_scope('Loss'):
    # Minimize error using cross entropy
    cost = tf.reduce_mean(-tf.reduce_sum(y*tf.log(pred), reduction_indices=1))
with tf.name_scope('SGD'):
    # Gradient Descent
    optimizer = tf.train.GradientDescentOptimizer(learning_rate).minimize(cost)
with tf.name_scope('Accuracy'):
    # Accuracy
    acc = tf.equal(tf.argmax(pred, 1), tf.argmax(y, 1))
    acc = tf.reduce_mean(tf.cast(acc, tf.float32))

# Initializing the variables
init = tf.global_variables_initializer()
# Create a summary to monitor cost tensor
tf.summary.scalar("TrainingLoss", cost)
# Create a summary to monitor accuracy tensor
tf.summary.scalar("TrainingAccuracy", acc)
# Merge all summaries into a single op
merged_summary_op = tf.summary.merge_all()

#TRAINING

# Launch the graph for training
with tf.Session() as sess:
    sess.run(init)
```

```

# op to write logs to Tensorboard
summary_writer = tf.summary.FileWriter(logs_path, graph=tf.get_defau
lt_graph())
# Training cycle
for epoch in range(training_epochs):
    avg_cost = 0.
    total_batch = int(mnist.train.num_examples/batch_size)
    # Loop over all batches
    for i in range(total_batch):
        batch_xs, batch_ys = mnist.train.next_batch(batch_size, shuf
file=True)
        # Run optimization op (backprop), cost op (to get loss value
)
        # and summary nodes
        _, c, summary = sess.run([optimizer, cost, merged_summary_op
],
                                feed_dict={x: batch_xs, y: batch_ys
}))
        # Write logs at every iteration
        summary_writer.add_summary(summary, epoch * total_batch + i)
        # Compute average loss
        avg_cost += c / total_batch
    # Display logs per epoch step
    if (epoch+1) % display_step == 0:
        print("Epoch: ", '%02d' % (epoch+1), " =====> Loss=",
              "{:.9f}".format(avg_cost))

    print("Optimization Finished!")

# Test model
# Calculate accuracy
print("Accuracy:", acc.eval({x: mnist.test.images, y: mnist.test.lab
els}))

```

```

```

1.3 Visualization with Tensorboard

Using [Tensorboard](#), we can now visualize the created graph, giving us an overview of the architecture and how all of the major components are connected. You can also visualize and analyse the learning curves.

In order to launch tensorBoard we follow these steps:

- Open a Terminal and run the command line "**tensorboard --logdir=log_files/**", it will generate an http link ,ex <http://666.6.6.6:6006>,
- Copy this link into a web browser
- Display the images!

Figure 1: Tensorboard visualization

2. The 99% MNIST Challenge using CNNs

2.1 LeNet5 Implementation

Now that we are familiar with familiar with **tensorFlow** and **tensorBoard**, we are going to build, train and test the baseline [LeNet-5](#) model for the MNIST digits recognition problem.

Further ahead we will make some optimizations to surpass 99% of accuracy. The best model so far achieved over 99.7% accuracy ([List of Results](#))

Figure 2: Lenet 5

The LeNet architecture accepts a 32x32xC image as input, where C is the number of color channels. Since MNIST images are grayscale, C is 1 in this case.

1. Layer 1: Convolutional. The output shape should be 28x28x6 Activation. sigmoid Pooling. The output shape

should be 14x14x6.

1. **Layer 2: Convolutional.** The output shape should be 10x10x16. **Activation.** sigmoid
2. **Pooling.** The output shape should be 5x5x16.
3. **Flatten.** Flatten the output shape of the final pooling layer such that it's 1D instead of 3D.
You may need to use **flatten* from `tensorflow.contrib.layers` import `flatten`
4. **Layer 3: Fully Connected.** This should have 120 outputs. **Activation.** sigmoid
5. **Layer 4: Fully Connected.** This should have 84 outputs. **Activation.** sigmoid
6. **Layer 5: Fully Connected.** This should have 10 outputs. **Activation.** softmax

2.1.1 LeNet5 model Implementation [Question 2.1.1]

The implementation draws classes and functions from the [Tensorflow API](#).

```
In [317]: # LeNet5 variables init
def weight_variable(shape):
    initial = tf.truncated_normal(shape, stddev=0.01)
    return tf.Variable(initial)

def bias_variable(shape):
    initial = tf.constant(0.1, shape=shape)
    return tf.Variable(initial)
```

COMMENT:

These functions are used for weights and bias initialization. The standard deviation in the weights can be tuned in case we find any strange behaviour in the CNN.

```
In [304]: # LeNet5 convolutional and max pool layers
def conv2d(x, W, pad='SAME'):
    return tf.nn.conv2d(x, W, strides=[1, 1, 1, 1], padding=pad)

def max_pool_2x2(x, pad='VALID'):
    return tf.nn.max_pool(x, ksize=[1, 2, 2, 1],
                           strides=[1, 2, 2, 1], padding=pad)
```

COMMENT:

The stride of value 1x1 in the convolutional will yield a same size feature map when used with padding 'SAME', which adds padding to ensure that the proportion stays equal after the convolution.

Using a stride of 2x2 in the max pool ensures reducing the features in half, which is why padding 'VALID' is used (equivalent to no padding).

```
In [338]: def LeNet5_Model(data, keep_pr=1, activFunc=tf.nn.sigmoid):
    input_data = tf.reshape(data, [-1, 28, 28, 1])

    # -----
    # -----VARIABLES-----
```

```
# -----
# Convolutional layer 1 variables
W_conv1 = weight_variable([5,5,1,6])
b_conv1 = bias_variable([6])

# Convolutional layer 2 variables
W_conv2 = weight_variable([5,5,6,16])
b_conv2 = bias_variable([16])

# Fully connected layer 1 param
W_fc1 = weight_variable([400, 120])
b_fc1 = bias_variable([120])

# Fully connected layer 2 param
W_fc2 = weight_variable([120, 84])
b_fc2 = bias_variable([84])

# Fully connected layer 3 param
W_fc3 = weight_variable([84, 10])
b_fc3 = bias_variable([10])

# -----
# -----COMPUTATIONS-----
# -----
# Convolutional layer 1 & max pooling
h_conv1 = activFunc(conv2d(input_data,W_conv1)+ b_conv1)
h_pool1 = max_pool_2x2(h_conv1)

# Convolutional layer 2 & max pooling
h_conv2 = activFunc(conv2d(h_pool1,W_conv2, pad='VALID')+ b_conv2)
h_pool2 = max_pool_2x2(h_conv2)

# Flattening
h_pool2_flat = tf.contrib.layers.flatten(h_pool2)

# Fully connected layer 1, sigmoid activation
h_fc1 = activFunc(tf.matmul(h_pool2_flat, W_fc1) + b_fc1)
drop_fc1 = tf.nn.dropout(h_fc1, keep_pr)

# Fully connected layer 2, sigmoid activation
h_fc2 = activFunc(tf.matmul(drop_fc1, W_fc2) + b_fc2)
drop_fc2 = tf.nn.dropout(h_fc2, keep_pr)

# Fully connected layer 3, softmax activation
predicted = tf.nn.softmax(tf.matmul(drop_fc2, W_fc3) + b_fc3)

return predicted
```

COMMENT:

First we define all the variables, then we compute all the activations using the functions defined above. We included a dropout in the fully connected layers, but is set off (with keep_p=1) by default.

2.1.2 Number of parameters in LeNet5 [Question 2.1.2]

```
In [306]: NParameters_LeNet5 = \
    2*(5*5*1*6) + \
    2*(5*5*6*16) + \
    400*120 + \
    120 + \
    120*84 + \
    84 + \
    84*10 + \
    10

print('Number of parameters in LeNet5: %d'%NParameters_LeNet5)
```

Number of parameters in LeNet5: 64234

COMMENT:

- Weights and biases for convolutional layer 1 = 2 x (5 x 5 x 1 x 6)
- Weights and biases for convolutional layer 2 = 2 x (5 x 5 x 6 x 16)
- Weights for fully connected layer 1 = 400 x 120
- Biases for fully connected layer 1 = 120
- Weights for fully connected layer 2 = 120 x 84
- Biases for fully connected layer 2 = 84
- Weights for fully connected layer 3 = 84 x 10
- Biases for fully connected layer 3 = 10

TOTAL: 64234

2.1.3 CNet: Tensorflow graph creation [Question 2.1.3]

The initial training will be using the parameters cited below:

Learning rate =0.1
 Loss Function : Cross entropy
 Optimisateur: SGD
 Number of training iterations= 10000
 The batch size =128

```
In [339]: def CNet ( modelName,
    learning_rate = 0.1,
    training_epochs = 100,
    batch_size = 128,
    display_step = 1,
    keep_p = 1,
    activationFunc = tf.nn.sigmoid,
    optimFunc = tf.train.GradientDescentOptimizer,
    X_train=mnist.train.images,
    y_train=mnist.train.labels,
    X_val=mnist.validation.images,
    y_val=mnist.validation.labels,
    X_test= mnist.test.images,
    y_test=mnist.test.labels,
    loadModel=None
```

```

):

# ----- DESCRIPTION OF DATASET -----
InputSize = X_train[0].shape[0]
OutputSize = y_train[0].shape[0]
TrainingSetSize = len(X_train)
ValidationSetSize = len(X_validation)
TestSetSize = len(X_test)

# ----- OUTPUT FOLDERS -----
logsFolder = 'log_files/' # useful for tensorboard
saveFolder = 'Models/'    # useful to restore the model

# ----- RESET GRAPH -----
tf.reset_default_graph()

# ----- DEFINE VARIABLES -----
# tf Graph Input: mnist data image of shape 28*28*1
x = tf.placeholder(tf.float32, [None,InputSize], name='InputData')
# 0-9 digits recognition, 10 classes
y = tf.placeholder(tf.float32, [None,OutputSize], name='LabelData')
# Dropout
keep_prob = tf.placeholder(tf.float32, name='DropoutKeepProbability')
)

# ----- DEFINE GRAPH NODES -----
with tf.name_scope('Model'):
    # Model
    model = LeNet5_Model(x, keep_prob, activFunc=activationFunc)

with tf.name_scope('Loss'):
    # Minimize error using cross entropy
    cost = tf.reduce_mean(-tf.reduce_sum(y*tf.log(model+1e-9), reduction_indices=1))
    #cost = tf.nn.softmax_cross_entropy_with_logits(model, tf.one_hot(y, 10))
with tf.name_scope('Optimizer'):
    #Optimization, using cost reduction
    optimizer = optimFunc(learning_rate).minimize(cost)

with tf.name_scope('Accuracy'):
    # Accuracies
    acc = CNNNetAccuracy(model, y)

# ----- INITIALIZE VARIABLES -----
init = tf.global_variables_initializer()

# ----- TRACK BATCH LOSS AND ACCURACY -----
# Create a summary to monitor cost tensor
tf.summary.scalar("BatchLoss", cost)
# Create a summary to monitor batch accuracy tensor
tf.summary.scalar("BatchAccuracy", acc)
# Merge all summaries into a single op
merged_summary_op = tf.summary.merge_all()

# ----- TRAIN MODEL -----
CNNtrain(model, cost, optimizer, acc,
          x, y, keep_prob, TrainingSetSize,
          X_train, y_train, X_val, y_val, X_test, y_test,

```

```

        init, merged_summary_op,
        modelName, saveFolder, logsFolder,
        learning_rate, training_epochs, batch_size, display_step ,
keep_p,
        loadModel
    )

```

COMMENT:

The CNNNet function creates the whole graph from scratch (Nodes, Variables, Summaries) and calls the function CNNTrain, which will be in charge of creating a session and running the graph.

2.1.4 CNNet: Accuracy [Question 2.1.4]

Here we implement the evaluation function for accuracy computation:

```

In [308]: def CNNetAccuracy(model, y):
            accuracy = tf.reduce_mean(
                        tf.cast( tf.equal( tf.argmax(model, 1),
                                          tf.argmax(y, 1)), tf.float32))
            return accuracy

```

COMMENT:

We've opted for defining the computation the way it should be set inside a Tensorflow graph. However, in order to execute it and obtain a value, we need to create the rest of the graph and use a session to perform the computation (it will be called in the training function)

2.1.5 CNNet Training [Question 2.1.5]

Here we implement training pipeline and run the training data through it to train the model. Other steps to consider are:

- Before each epoch, shuffling the training set.
- Printing the loss per mini batch and the training/validation accuracy per epoch. (Display results every 100 epochs)
- Saving the model after training
- Printing after training the final testing accuracy

```

In [340]: def read_my_file_format(filename_queue):
            reader = tf.SomeReader()
            key, record_string = reader.read(filename_queue)
            example, label = tf.some_decoder(record_string)
            processed_example = some_processing(example)
            return processed_example, label

            def input_pipeline(filenamees, batch_size, num_epochs=None):
                filename_queue = tf.train.string_input_producer(

```

```

        filenames, num_epochs=num_epochs, shuffle=True)
    example, label = read_my_file_format(filename_queue)
    # min_after_dequeue defines how big a buffer we will randomly sample
    #   from -- bigger means better shuffling but slower start up and mo
re
    #   memory used.
    # capacity must be larger than min_after_dequeue and the amount larg
er
    #   determines the maximum we will prefetch. Recommendation:
    #   min_after_dequeue + (num_threads + a small safety margin) * batc
h_size
    min_after_dequeue = 10000
    capacity = min_after_dequeue + 3 * batch_size
    example_batch, label_batch = tf.train.shuffle_batch(
        [example, label], batch_size=batch_size, capacity=capacity,
        min_after_dequeue=min_after_dequeue)
    return example_batch, label_batch

```

COMMENT:

We import the pipeline functions that come from tensorflow:
https://www.tensorflow.org/programmers_guide/reading_data

```

In [336]: def CNNtrain(model, cost, optimizer, acc,

            print ("    Saving model in file: %s"%(saveFolder+modelName))

```

COMMENT:

This function implements the session, and using and input pipeline, it fetches batches of data to the graph and runs it in order to obtain results.

The model is evaluated in the end, and we have added a possibility to load previous models as well as saving it. The training and validation accuracies are calculated on every epoch, while test accuracy is only calculated in the end.

In order to keep the original version available, we have commented the original batch function from the mnist dataset.

```

Final accuracies:
~ TrainAcc: 99.273 %
~ ValAcc: 98.760 %
~ TestAcc: 98.760 %
Saving model in file: Models/lenet5-model

```

COMMENT:
First accuracy obtained is 98.76%! very close to the objective of 99%.

2.1.6 Visualization of results with Tensorboard [Question 2.1.6]

We use tensorBoard to visualise and save the LeNet5 Graph and all learning curves. The data is then converted into CSV using the GUI drom tensorboard and is then plotted using Excel. The resulting figures are:

Figure 3: LeNet5 Graph

Figure 4: LeNet5 Training

COMMENT:
There is an initial step of search for a steep surface in the loss function, and in the epoch 8-9 it starts converging fast, completely stabilizing after epoch 50.

2.2 LeNet5 Optimization

2.2.1 Parameter Tuning [Question 2.2.1]

We change the sigmoid function to a Relu and perform the next steps:

- Retrain the network with SGD and AdamOptimizer. Compare them with the best parameters:

Optimizer	Gradient Descent	AdamOptimizer
Validation Accuracy	98.760 %	99.080 %
Testing Accuracy	98.670 %	99.110 %
Training Time	8048 s	2670 s

- Try with different learning rates for each Optimizer (0.0001 and 0.001) and different Batch sizes (50 and 128) for 10000 Epochs.
- For each optimizer, plot (on the same curve) the **testing accuracies** function to **(learning rate, batch size)**
- Did you reach the 99% accuracy ? What are the optimal parametres that gave you the best results?

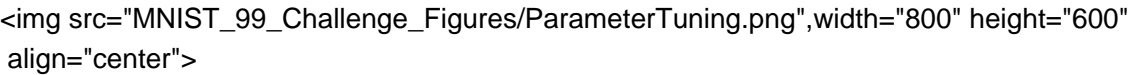

Figure 5: Parameter Tuning

COMMENT:

Clearly the Adam Optimizer is better than the SGD, and in much less time.

We tried with several parameters and the best combination we found is **AdamOptimizer, lr=0.001 bs=128**.

Also, we achieved the desired accuracy of 99%!

```

Saving model in file: Models/lenet5-model_adam_relu_lr00001_bs128

```

COMMENT:

As seen in the training, the AdamOptimizer gets NaN at a certain point. In order to make it numerically stable, we have included a small value in the logarithm of the loss node in the graph (1e-9), and we have reduced the standard deviation in the weight initialization

```
In [320]: # Trying parameters with Adam Optimizer - AFTER CHANGING THE OPTIMIZER!
# (Weight init & safe softmax)
setOfParams = [ [0.001, 100, 50, 'lenet5-model_adam_relu_lr0001_bs50'],
                 [0.001, 100, 128, 'lenet5-model_adam_relu_lr0001_bs128'],
                 [0.0001, 100, 50, 'lenet5-model_adam_relu_lr00001_bs50'],
                 [0.0001, 100, 128, 'lenet5-model_adam_relu_lr00001_bs128']
               ],

for p in setOfParams:

```

COMMENT:

Other measure that we took was to stop the training when reaching 100% accuracy. Nevertheless, even with 100% accuracy the loss keeps going down, which is why we implemented the model loading and retrained the best model for other 30 epochs:

```
In [344]: # Ending the training of the best optimizer
CNNNet (modelName='lenet5-model_best',
        learning_rate = 0.001,
        training_epochs = 30,
        batch_size = 128,
        activationFunc=tf.nn.relu,
        optimFunc=tf.train.AdamOptimizer,
        loadModel='lenet5-model_adam_relu_lr00001_bs128'
)

2.2.2 Dropout layer [Question 2.2.2]

What about applying a dropout layer on the Fully conntected layer and then retraining the model with the best Optimizer and parameters(Learning rate and Batsh size) obtained in the previous section? (probability to keep units=0.75). For this stage we ensure that the keep prob is set to 1.0 to evaluate the performance of the network including all nodes.

```
In [312]: CNNNet ('lenet5-model',
                learning_rate = 0.001,
                training_epochs = 100,
                batch_size = 128,
                activationFunc = tf.nn.relu,
                optimFunc=tf.train.AdamOptimizer,
                keep_p = 0.75
            )
```

```

Training Finished in 2681.9 seconds.
Final accuracies:
~ TrainAcc: 99.991 %
~ ValAcc: 99.200 %
~ TestAcc: 99.040 %
Saving model in file: Models/lenet5-model
```

COMMENT:

We had everything implemented in the functions above, we only needed to call it.

We once again surpass the 99% frontier! In fact, since the validation accuracy is 99.2%, this suggests that further playing with the keep probability could lead to an even better model. However, this is out of the scope of this notebook
